## Project description

Away from bagged goods - towards the practical small silo. The small silo made of larch wood with a capacity of 30 m<sup>3</sup> makes maintenance work on the road network of Tavannes in the Bernese Jura much easier. The start of professional winter maintenance work brings many advantages; for example, improved work safety and quality for the employees, sustainable management without plastic waste and efficient loading of the gritting vehicles. The precise control and management of salt stocks are also part of it.
